## Density Worksheet

Name $\qquad$ Section $\qquad$
Chemistry 101
Density is the ratio of the mass of the substance to the volume of the substance at a given temperature. Density has units of $\mathbf{g} / \mathrm{cm}^{3}$ or $\mathbf{g} / \mathbf{c} . c$. or $\mathrm{g} / \mathrm{mL}$ for liquids and solids, and $\mathrm{g} / \mathrm{L}$ for gases.

Density is an intensive property. Density varies with change in temperature.

1. A gold-colored ring has a mass of 18.9 grams and a volume of 1.12 mL . Is the ring pure gold? (The density of gold is $19.3 \mathrm{~g} / \mathrm{mL}$.)
2. What volume would a 0.871 gram sample of air occupy if the density of air is $1.29 \mathrm{~g} / \mathrm{L}$ ?
3. Pumice is volcanic rock that contains many trapped air bubbles. A 225 gram sample occupied 236.6 mL . What is the density of pumice? (Answer is $0.951 \mathrm{~g} / \mathrm{mL}$ )

Will pumice float on water? The density of water is $1.0 \mathrm{~g} / \mathrm{mL}$.)
4. A cup of sugar has a volume of 237 mL . What is the mass of the cup of sugar if the density is $1.59 \mathrm{~g} / \mathrm{mL}$ ? (Ans. is 377 grams)
5. Which has the greater mass, 1 liter of water or 1 liter of gasoline? The density of water is $1.00 \mathrm{~g} / \mathrm{mL}$ and that of gasoline is appoximately $0.68 \mathrm{~g} / \mathrm{mL}$.
6. A crumpet recipe calls for 175 grams of flour. According to Julia Child's data, the density of flour is $0.620 \mathrm{~g} / \mathrm{mL}$. How many mL of flour are needed for this recipe? (Ans. is 282 mL )
7. From their density values, decide whether each of the following substances will sink or float when placed in sea water, which has a density of $1.025 \mathrm{~g} / \mathrm{mL}$.

Gasoline $0.66 \mathrm{~g} / \mathrm{mL}$
Mercury $13.6 \mathrm{~g} / \mathrm{mL}$

Asphalt $1.2 \mathrm{~g} / \mathrm{mL}$
Cork $0.26 \mathrm{~g} / \mathrm{mL}$
8. Mercury is a liquid metal having a density of $13.6 \mathrm{~g} / \mathrm{mL}$. What is the volume of 1.00 lb of mercury metal? $(33.4 \mathrm{~mL})$
9. A sample of lead is found to have a mass of 32.6 g . A graduated cylinder contains 2.8 mL of water. After the lead sample is added to the cylinder the water level reads 5.7 mL . Calculate the density of the lead sample. $(11 \mathrm{~g} / \mathrm{mL})$
10. A piece of magnesium is in the shape of a cylinder with a height of 5.62 cm and a diameter of 1.34 cm . If the magnesium sample has a mass of 14.1 g , what is the density of the sample? $(1.78 \mathrm{~g} / \mathrm{mL})$
